

# Environmental Policy

14 July 2020

Laserchill recognises the need to be an active company in both environmental protection and the promotion of good working practices designed to minimise the effects of environmental pollution.

In 1993, Ozone depleting CFC refrigerants were banned, but there are still detrimental effects to global warming if refrigerant is released into the atmosphere. New legislation has made it illegal to work with refrigerants without approved training and certification. Laserchill already operates within these guidelines and has done since being established. Our team of experts are trained in the safe handling of refrigerants used in air conditioning and refrigeration systems.

Laserchill is committed to the following:

- To handle refrigerant safely.
- To work with suppliers to provide goods and service with the minimum adverse environmental impact.
- Commit ourselves to the prevention of pollution avoiding the use of toxic and environmentally damaging materials where possible.
- Conducting relevant environmental education and training to improve awareness, knowledge and skills amongst our staff.

Laserchill is committed to continually improving its performance by regularly reviewing its environmental impacts, performance, and effectiveness on an annual basis.
